# Why an environmental study?

The 2004 Arizona WNV Outbreak posed many questions, one of the more interesting ones being, “Why did some areas of The Valley experience clusters of cases while comparable areas had no cases at all?” Were there environmental factors which might account for the differences in the numbers of cases?

# WNV Background

- 1937: 1<sup>st</sup> identified (in Africa)
- 1999: Introduced to USA (New York City)
- 2003: 1<sup>st</sup> WNV cases in Arizona (15)
- 2004: Outbreak in Arizona peaked (391)
- 2005: Arizona human WNV cases at 112
- Nationwide (1999-2005), there have been 19,543 diagnosed human cases with 761 deaths

# Human WNV cases in Maricopa County, AZ, 2004

# What Locations to Study?

- 5 high-case count\* zip codes selected
- 7-11 case residences in each zip code
- 5 zero-case count zip codes selected
- 7-11 randomly selected control residences in each zip code
- Net for study: 40 case houses/45 controls
  - \*7 or more cases

# What variables to study?

**\*Location info**

**\*Date**

**\*Case v. control area**

**\*Age and type of construction**

**\*Presence of porches**

**\*Presence of clutter, bird baths, dog bowls, flower pots, etc.**

**\*Landscaping 1: Composition of ground cover**

**\*Landscaping 2: Type and number of trees**

**\*Landscaping 3: Percent canopy coverage**

**\*Landscaping 4: Shrubs**

**\*Critters: Presence/type of birds seen**

**\*Horses or livestock**

**\*Proximity to washes, greenbelts, waterways, industrial/agric zones**

**\*Is area flood irrigated?**

**\*Swimming pools? Present/Absent and maintenance**

# We saw a variety of landscaping

From no vegetation whatsoever...

To lushly tropical...

And everything in between.

# Results:

<u>% Canopy Cover:</u>	<u>High Case</u> <u>Area</u>	<u>Control</u> <u>Area</u>	<u>Probability</u>
<25%	17	20	0.011*
>25%	20	12	
<u>Age of</u> <u>Construction:</u>	<u>High Case</u> <u>Area</u>	<u>Control</u> <u>Area</u>	<u>Probability</u>
<1990	33	28	0.008*
1991-2004	4	16	
<u>Ground Cover:</u>	<u>High Case</u> <u>Area</u>	<u>Control</u> <u>Area</u>	<u>Probability</u>
Lawn	18	15	0.054
No Lawn	14	29	

\*Statistically significant at the 95% level or greater

## More Results:

<u>Presence of Birds:</u>	<u>High Case</u> <u>Area</u>	<u>Control</u> <u>Area</u>	<u>Probability</u>
Yes	17	23	0.427
No	23	22	
<u>Near Greenbelt:</u>	<u>High Case</u> <u>Area</u>	<u>Control</u> <u>Area</u>	<u>Probability</u>
Yes	30	30	0.861
No	10	12	
<u>Swimming Pool:</u>	<u>High Case</u> <u>Area</u>	<u>Control</u> <u>Area</u>	<u>Probability</u>
Yes	9	7	0.376
No	29	37	

\*Statistically significant at the 95% level or greater

# Conclusions

Our results suggest that features of mature, non-water conserving neighborhoods may be contributing factors to the breeding and harborage of WNV-carrying mosquitoes and increased incidence of human WNV infection.
